You may soon be able to send your pals a glass of virtual lemonade thanks to a cyber cocktail system which mimics the miracles of Jesus.

Scientists have found a way to send the taste and color of the soft drink through the internet.

A sensor collects the acidity and color of a drink – in this case a glass of freshly poured lemonade.

The information is sent across the internet to a smart tumbler in a different location.

The tumbler has LED lights to mimic the color and is packed with electrodes which are released to give the water a sour taste, just like lemonade.

Researcher [Nimesha Ranasinghe](#) wants to add smells to the mix, too.

He's already created the world's first digital lollipop, which uses electric pulses to stimulate different tastebuds.

Virtual interactions could become commonplace thanks to incredible scientific advances.

Researchers have already created virtual kissing tools, which mimic a person's lip movements so they can [smooch from afar](#).
